TITLE: An electron microscope study of vacuum deposited copper con-
densates 27

SOURCE: Fizika metallov i metallovedeniye, v. 18, no. 3, 1964,
461-464

TOPIC TAGS: vacuum copper condensate, vacuum deposited copper film,
vacuum deposited film, copper film, film microhardness, copper film
structure

ABSTRACT: Copper films 20-50 μ thick deposited in a 10^{-5} Torr
vacuum at a condensation rate of 1 μ /min on a copper substrate
having a temperature of 120 to 340°C were studied by means of an elec-
tron microscope in an attempt to determine factors contributing to
their strength. The study revealed that the structure of the film
depends on the temperature of the substrate. Films deposited at
lower temperatures of substrate had a more dispersed structure and

18

Card 1/3

L 16316-65
ACCESSION NR: AP4046098

2

a higher microhardness than those deposited on hotter substrates (see Enclosure). The films deposited on the 120C substrate had a more dispersed structure than foil cold-rolled with 80% reduction. Vacuum condensates deposited at 160C had the same size of crystallites as cold-rolled foils but considerably higher hardness (240 kg/mm^2 versus 125 kg/cm^2). In Leavine films, a finely dispersed structure is observed on the very surface only; the grain size increases toward the substrate. Deeper lying layers have a heterogeneous structure consisting of fine grains mixed with coarse. The surface layer consisting of uniformly dispersed fine grains amounts to 10-20% of the total film thickness of 50μ obtained at a condensation rate of $0.5-1 \mu/\text{min}$. Orig. art. has: 4 figures and 1 table.

Zhur Obshch Biol, Vol 12, No 4, pp 270-285

The biological role of nucleic acids and nucleo-proteins is very great. The protoplasmic complex of a number of organs of exptl rabbits, raised on a modified diet, revealed a change in iso-electric point to acidity. It may be considered as proven that changes in iso-electric point of protoplasmic complex take place during aging process of animal organism. Reproduction of intercellular matter in various tissues goes through the same biochemical aging evolution and reflects, in the main, the same regularity of ontogenesis as does the whole organism.

in-ta biol. i biol. fak., 30, 61-71

Abstract : Studies were conducted on the crossbreed vigor in hybrids from the crossbreeding of rabbits' species such as white giant, flemish and chinchilla. Weight, body and head length were considered; the isoelectric point of cytoplasm and karyoplasm in parietal acid cells and in major cells of glands in fundus ventriculi mucosah had been determined both in the primary forms and in hybrids. For this purpose, Pushinger-Ruskin method was used.

In these very cells the content of KMA was determined. According to the morphologic and physiologic indications, the crossbreed vigor in hybrids F_1 was represented most; it diminishes in F_2 but does not disappear completely even in F_3 . The material was not biometrically analyzed. Therefore, it is rather difficult to establish an authenticity degree of the obtained diversities. Isoelectric point of the cytoplasm changes depending upon the age. When a rabbit is four days old and is a crossbreed of white giant and flemish - the isoelectric point of the cytoplasm in parietal acid cells lies at pH 2,49 and if this is a primary form of a white giant and flemish - at pH. 66. If a rabbit is four months old it is accordingly 3.05 and 3.27, one year old 3.25-3.54 and 3.53. The isoelectric point of the cytoplasm in hybrids

ORG: Khar'kov State University im. A. M. Gor'kiv (Khar'kovskiy
gosudarstvennyy universitet)TITLE: Measurements of polarization of coherent radio emission of
extensive air showersSOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v
redaktsiyu. Prilozheniya, v. 3, no. 4, 1966, 186-190

TOPIC TAGS: extensive air shower, radio emission, Cerenkov radiation

ABSTRACT: Measurements of coherent radio emission of extensive air showers have shown that it is possible to record such radiation. The possibility had been predicted in works in which coherent radio emission due to an electron excess was studied. An electron excess appears during the development of an electron-photon avalanche in an extensive air shower, and its emission is ordinary Cerenkov radiation characterized by radial polarization. The charges of an extensive air shower can be separated by means of the Earth's constant magnetic field.

Card 1/2

2

L 20620-66

ACC NR: AP6009720

However, in this case, radiation due to a magnetic retardation, dipole radiation, and radiation of the current will appear. This radiation is polarized primarily in the plane of the moving electron cluster, i.e., in the east-west direction. Experiments on the separation of radio emission polarized in the east-west direction from Cerenkov radiation showed only that coherent radiation is linearly polarized in the east-west direction. However, detection of linear polarization of radio emission of an extensive air shower in the east-west direction does not make it possible to determine the nature of the radiation. TITLE: Measuring the coherent radio emission of extensive air showers of cosmic rays

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v. 30, no. 10, 1966, 1705-1707

TOPIC TAGS: cosmic ray, cosmic ray shower, ~~extensive air shower~~ radio emission, dipole antenna, meteorelogie radar

ABSTRACT: Experimental results on the coherent radioemission of extensive air showers of cosmic rays are reported. Measurements were made using a system which included 24 east-west oriented dipoles. The effective area of the antenna was 950 m^2 ; the minimum received threshold of radioemission was $10^{-23} \text{ W} \cdot \text{m}^{-2} \cdot \text{cps}^{-1}$. After amplification, detection, and discrimination the antenna signal passing through a delay line was applied to Geiger-Meuller counters with the counting rate of $4.5 \text{ showers/hour}^{-1}$. Flashes of Cherenkov light were registered by two FEU-44 photomultipliers, which were installed 46 m from the center of the antenna. The viewing angle of the light receivers was 90° and the minimum threshold sensitivity was $400 \text{ photon} \cdot \text{cm}^{-2}$. Measurements were made at $\lambda = 23.6 \text{ m}$ during clear moonless nights only. During 42 hours of operation, 36 radio pulses from extensive air showers were registered. The system was operated with Geiger-Mueller counters for 40 hours. Only 3 pulses were recorded

during that period. The authors conclude that signals with energy $> .6 \times 10^{18}$ ev were effectively registered. Orig. art. has: 2 figures.

TITLE:

Experience in Overall Automation of an Acetic Acid Regeneration Plant (Opyt kompleksnoy avtomatizatsii tsekha regeneratsii uksusnoy kisloty)

PERIODICAL:

Khimicheskaya promyshlennost', 1958, Nr 8,
pp 481 - 486 (USSR)

ABSTRACT:

Over the three years of operation of the automated department for the regeneration of acetic acid at the Vladimirovskiy khimicheskiy zavod (Vladimir Chemical Plant) experience has been gathered which can be evaluated and applied in the automation of other chemical plants. The regeneration process takes place in three stages: 1) Extraction of the aqueous solution by means of ethyl acetate in packed extraction columns (20 m high, 750 mm diameter), 2) Rectification of the ester acid layer (rectification column, 2 m in diameter, volume of cupola 16 cu. m, surface of tubular heater 50 sq.m, surface of condenser 150 sq. m), 3) Regeneration of the ester-water layer for the production of ethyl acetate, separation of water in a packed column (height 14.5 m, dia-

Regeneration Plant

SOV/64-58-8-8/19

meter 500 mm). A regulating system was used to automate the extraction process (Fig 1). It consists of a diaphragm, separator vessels (of Kh18N12M3T steel), a flow counter with a differential gauge and pneumatic cells, type DPP, a secondary apparatus 04-MS-610, a control panel VPDU and a pneumatic control valve. In the rectification process (Fig 2) a level meter 04-DPP-410 is used to automatically control the acid level in the cupola, while the quantity of the ester acid mixture and ethyl acetate is recorded on the automatic apparatus MS-610. The water level in the column is controlled by a RUKTs regulator. Level meters RUTs are used to control the level in the preparation of the acetic acid solution. The control room (about 40 sq.m) is separated from the other rooms according to regulations. The automated system was put up by the KIP plant with the assistance of the staff of the regeneration department. Automation resulted in some difficulties which have been eliminated, e.g. by using Kh18N12M3T and 1Kh18N9T steel and cast iron instead of bronze etc. When automation was completed after 12 - 13 months, energy consumption could

Card 2/3

Experience in Overall Automation of an Acetic Acid
Regeneration Plant

SOV/64-58-8-8/19

be reduced by 5 - 10%. Ethyl acetate consumption per ton of acetic acid dropped by 17.2%, steam consumption by 13.6%, electric power by 15.5%, water by 18.6%. It was possible to reduce the staff of the department by 30%, while productivity increased by 40%. Thus the cost price of acetic acid dropped by 17.5%, annual savings amount to 2,6 million roubles. On the basis of the experience acquired, a plan for the improvement and expansion of automation has been drawn up. There are 5 figures.

Title : The Fluctuations of Skin Sensitivity to Tuberculin on Patients with Tubercular Lupus in the Process of Treatment with Vitamin D₂.

Orig Pub : Material po obmenu Nauch. inform. Ukr. n.-i. in-ta tuberkuleza, 1955, No 2, 140-142

Abstract : There was investigated the skin sensitivity to tuberculin (Pirke reaction with dilutions of tuberculin from 0.5 to 10%) and the dermographic reaction on 121 patients with tubercular lupus and for different periods of treatment by vitamin D₂ (the average total dose for adults was 15 million International Units, for children 8 million I.U.). In the process of treatment, along with the healing of tubercular nidi, in a considerable number of patients the strengthening of both reactions are noted as occurring even in the initial period of treatment.

PERIODICAL: Gornyy Zhurnal, 1958, Nr 1, p 76 (USSR)

ABSTRACT: This note represents an answer of Volovikov on the Vasil'yev article published in Gornyy Zhurnal, 1957, Nr 1. Volovikov disagrees with Vasil'yev on the question of comparing the costs of automobile and railroad transport and points out that conditions in the USSR are different from those in the USA. The Volovikov conclusion is that the costs of both of these kinds of transport are approximately the same up to 4 km. When the transport distance increases to 10 km, railroad transportation is less expensive than automobile transportation by 1.5 to 2 times, but not 3 to 5 times as was asserted by Vasil'yev.

The composition of the Klyus'ma river slimes and slime water. I. S. Svetlov and R. P. Volovitskaya. *Zapiski Politekhnicheskogo Instituta* 1939, No. 11, 67-67; *Khim. Referat. Zhur.* 1940, No. 7, 19.—Twenty-nine specimens of slimes were investigated for their ash content and the content of residue (ash, i.e. 10% HCl). The content of ash varied from 71.1 to 90.2 (based on the dry substance) and that of the insol. residues from 63.9 to 100.0%. The content of the insol. residue paralleled that of ash. The content of organisms at the bottom varied between 0.28 and 16.7 g./cu. m. It was proportional neither to the content of ash nor to that of the insol. residues. Eight of these specimens were examined in greater detail. The results of analyses for the HCl-sol., for natural resins and of the contents of C, N and Hg are given. The amt. of siliceous salts obtained by pressing out these slimes was 70-80% of the total content of water.

Title: Investigation of the Sewage of the Moscow Meat Combine imeni A. I. Mikoyan

Original
Periodical: Tr. Vses. n.-i. in-ta myas. prom-sti, 1955, No 7, 158-161

Abstract: Daily sewage (S) discharge at the combine amounts to 8,000-12,000 m³ (of which ~50% are household refuse) with a coefficient of nonuniformity of 0.6-1.5. Over the rumen sewers are discharged ~8% S. Composition of S, according to principal indexes (in mg/l): coarse dispersed admixtures 1,042 (of which 91.2% organic), dense residue 3,084, oxidizability (O₂) 143, BOD₅ 724, BOD₂₀ 1,010, fats 587. The available purification units (grease trap and manure trap) do not ensure sufficient degree of S purification. Ruman presses reduce the moisture content of rumen to 68-79%.

Potentiometric determination of iron in the presence of aluminum and titanium. V. K. Pimenov and V. I. Vol'vanskii. Uchebnoye Zapiski Sverdlov. Gorodovsk. Univ., 19 [4] 106-18 (1940); Khim. Referat. Zhur., 4 [3] 83 (1941).—The titration is done with a solution of Cr₂O₇, after oxidizing the Fe. The Cr₂O₇ solution is prepared according to Thornton (*Ind. Eng. Chem., Anal. Ed.*, 4 [2] 240-43 (1932)) as modified by Zas'ko and Shlyapnikova (Zavodskaya Lab., 8 [9] 777-84 (1934)). The titration is done in an atmosphere of CO₂ at 20°, with constant stirring. The strength of the Cr₂O₇ solution is determined by titrating it potentiometrically with a 0.1 N solution of FeCl₃ under conditions similar to those of the titration of the unknown. The FeCl₃ is standardized gravimetrically, the Fe being precipitated with NH₄OH. To study the effect of other methods, the authors determined Fe in solutions containing Fe 0.0007 and Al up to 0.1, Ti up to 0.1, Ca up to 0.2, Mg up to 0.05, K up to 0.01, and Na up to 0.01 gm. per 100 ml. The deviations from the gravimetric method were ± 0.5 gm. This method is applicable for determining Fe in clay, cement, phosphorite, siderite, sphalerite, and bauxite. M. H.

Effect of vitamin B6 deficiency on formation of mercapturic acid
and on transulfuration in the rat organism. Doklady Akad. nauk SSSR
93 no.1:111-114 1 Nov 1953. (CLML 25:4)

1. Presented by Academician N. N. Anichkov 7 September 1953.

VOLOVNIK, B. Ya.

Effect of deficiency of vitamin B₆ on formation of mercapturic acid and on transsulfuration in the rat. E. V. Goryachenkova, B. Ya. Volovnik, and P. R. Zafed'man (Inst. Biol. and Med. Chem. Acad. Med. Sci., Moscow). Doklady Akad. Nauk S.S.R. 93, 111-14 (1953).—Avitaminosis B₆ produced by a diet deficient in this vitamin and contg. about 40% casein was followed by tracing S of S-labeled DL-methionine. Without added methionine the animals excreted about 29.0% of administered PbBr as mercapturic acid in the normal state, and about 23.2% in the B₆-avitaminotic state, indicating little if any disturbance of formation of mercapturic acid. With addnl. feeding of methionine the figures were 38.5% for controls and 34.6% for test animals, again showing little if any effect of vitamin deficiency. The detn. of radioactivity of total S and cystine S in the protein of all internal organs taken after 24 hrs. following radiomethionine injection showed that both control and the test animals assimilate S at the same rate. However, in shorter exps. (4-6 hrs.) there is a definite decline of active S content in the cystine S of the liver (45-60%) and total protein S (20-40%) of the avitaminotic animals, the results being most pronounced when 80 mgi. addnl. methionine was given the animals.

EXCERPTA MEDICA Sec.2 Vol.9/9 Physiology, etc. Sept 56

3961. VOLOVNIK B. Ya. Lab. for Chem. of Nitrogen Metabolism, Inst. of biol. and med. Chem., Acad. of med. Sci., Moscow. "The influence of B₆-avitaminosis upon the metabolism of L- and D-methionine-sulphur in the animal organism (Russian text)" BIOKhimija 1955, 20/4 (490-494) Tables 2

S³⁵-labelled D- and L-methionine (I) were injected into pyridoxine (II)-deficient white mice and controls, and the S³⁵ content of whole body proteins, as well as that of cysteine alone, was determined after different periods. The incorporation of S³⁵ was found to be significantly reduced under II deficiency. Thus confirms the results of earlier experiments with enzyme preparations, showing that II is involved in the in-vivo synthesis of cysteine by transsulphonation. A very marked difference was observed between the effects of the 2 stereoisomers of I: while the S³⁵-uptake from L- and DL-I was reduced only 20-37%, that from D-I was reduced 44%. This is ascribed to the fact that in II-avitaminosis the conversion of L- to D-amino acids via keto-acids is affected in such a way that there is very little formation of the isomer needed for utilization. In prolonged experiments a compensation of the first reduced S³⁵-utilization occurs, showing a certain transsulphonating capacity of the organism, which is able to overcome the lack of II.

TOPIC TAGS: ocean acoustics, ocean floor topography, oceanography, underwater acoustics, acoustic equipment, oceanographic instrument

ABSTRACT: Some experimental results of the study of the coefficient of sound reflection from the Atlantic Ocean bottom are given, based on measurements made in 1961—62 over a distance of 20,000 miles. The measurements were made at normal incidence using Kelvin-Hughes MS-26 echo sounders at 9.6 kcps and N-100 recorders. Bottom relief was simultaneously recorded on a Ladoga precision graphic recorder. The difference between the experimentally determined coefficients and those computed from the parameters of bottom sediments is shown. A graph is given showing the averaged reflection values along a track having an irregular bottom relief. The conclusion is drawn that bottom relief considerably influences the value of the reflection coefficients. Orig. art. has: 1 figure.

TITLE: Determination of some parameters of irregularities of the ocean floor by acoustic methods

SOURCE: Okeanologiya. v. 6, no. 6, 1966, 1080-1085

TOPIC TAGS: ocean floor topography, acoustic detection, acoustic scattering, underwater acoustics

ABSTRACT: The scattering of sound by the ocean floor was measured in 1961-62 in 100 regions of the Atlantic Ocean and shown to be related to large geomorphological nonuniformities which cannot be determined by echosounding. A 200-g powder charge, reception by a nonoriented hydrophone, and recording and frequency analysis by a magnetophone and band filters, respectively, were used to measure the scattering of 1-30-kc/sec waves at 5-60° angles of incidence. Scattering was correlated with large and small irregularities as defined by the theoretical equation

$$M_B(\theta, \gamma) \sim \frac{p^3}{\cos^4 \theta} e^{-p^2 \tan^2 \theta} + 4(k\sigma)^3 (kr_0)^3 \cos^4 \theta, \quad (1)$$

$$k = \frac{2\pi f}{c}, \quad p = a/2h,$$

M_B being the coefficient of scattering, a and r_0 the radius of autocorrelation of the deviation of large and small nonuniformities, respectively, from average flatness, h and σ_0 the quadratic average height of large and small nonuniformities, respectively, and θ the angle of incidence. Angular dependence of the scattering of sound was shown to be applicable for the determination of the mean slopes of large irregularities; such nonuniformities, having moderate slopes (to 10—15°) give scattering primarily at low angles of incidence, the mode of scattering depending in this region on the slope of nonuniformities, without dependence of scattering on frequency.
